EDUCATION

BS/MS in Computer Science

George Mason University

Coursework: Data Structures and Algorithms, Operating Systems, Distributed Systems, Computer Graphics, Database Systems, Computer Architecture

Jan 2024 – Dec 2027

Fairfax, VA

TECHNICAL SKILLS

Languages: C, Python, Java, JavaScript/TypeScript

Build, CI, & Dev Tools: CMake, Make, Docker, Jenkins, Git, GitHub

Backend & Frameworks: FastAPI, REST, gRPC

Cloud & Databases: Azure, AWS, GCP, PostgreSQL, MongoDB, Redis

EXPERIENCE

Software Engineering Intern

Apple

April 2026 – June 2026

San Diego, CA

- Built Mend, an agentic debugging system for CoreMedia and AVFoundation XCTest workflows, reducing engineer time spent investigating flaky unit and integration test failures.
- Designed a deterministic LLM harness around XCTest logs, sysdiagnose data, and test code to reproduce failures, classify root causes, and generate candidate fixes or engineer-ready bug reports.
- Shipped an MCP server that exposed Mend's debugging tools to Claude Code, allowing engineers to trigger investigations and inspect diagnostic results directly from their development workflow.

Backend Engineering Intern

HubSpot

January 2026 – March 2026

Boston, MA

- Built a Java threat intelligence service that ingested security reports from Slack and RSS feeds to extract vulnerabilities, affected products, threat actors, and relevant HubSpot services.
- Connected extracted intelligence with repository analysis workflows to identify affected libraries and frameworks, helping security engineers triage exposure during incidents such as the LiteLLM PyPI compromise.

Undergraduate Research Assistant

George Mason University DCXR Lab

February 2025 – January 2026

Fairfax, VA

- Built a Unity and C# HoloLens AR prototype for firefighter navigation, using spatial mapping to help first responders identify entrances and navigate GMU's FUSE building during emergency response scenarios.
- Built AR study prototypes and helped run 3 user studies with 50+ participants for SIGCHI and SIGGRAPH research on mixed-reality interaction, navigation, and role-aware AR agents.

Backend Engineering Intern

Zscaler

May 2025 – August 2025

San Jose, CA

- Built a C++20 prototype for synthetic website monitoring using Chromium Embedded Framework, running headless Chromium sessions on Zscaler servers to measure customer site performance and availability.
- Implemented authenticated browser workflows by driving Chromium's V8 engine from C++, executing JavaScript to simulate logins, clicks, form submissions, and other real user actions.

Software Engineering Intern

Parsons Corporation

June 2023 – September 2023

Centreville, VA

- Built ParsonsGPT, an internal AI platform for engineering and proposal teams, using .NET, React, PostgreSQL, and secure RAG pipelines on Azure to support daily usage by 10,000+ users.
- Built a graph-based workflow orchestration system in ParsonsGPT that coordinated multi-step LLM pipelines, tool execution, and document processing for engineering and proposal automation tasks.

PROJECTS

Web Translation Platform | *Python, FastAPI, Docker, Redis, Nginx, Hugging Face, DigitalOcean*

- Built and deployed a Python translation platform on DigitalOcean using FastAPI, Docker, Nginx, and Redis to scrape 300+ novels, queue 200K+ chapters, and publish translated content automatically.
- Fine-tuned a Hugging Face BERT model in Google Colab on synthetic LLM-generated datasets for multilingual noun extraction across Chinese, Japanese, and Korean text.
